Great product thinking deserves clear communication.

Meet Vira — your personal AI communication mentor for Product Managers.

The promise

Diagnose one gap. Learn one technique. Practice again. See the difference.

mycommpal.vercel.app

“For practice I would use Vira.” — early tester

Illustrative product journey visual

The problem is clear, specific, and real.
PMs often know the answer—but struggle to articulate it clearly in the room.

9 of 14
participants in user research reported articulation-related challenges.

Current workaround
Notes, self-practice, polite colleague feedback, generic ChatGPT prompts, videos and books.

Why that fails
They prepare content, but not delivery. Feedback is generic, delayed, or too polite.

Career impact
A strong recommendation can sound vague, scattered, or weak under pressure.

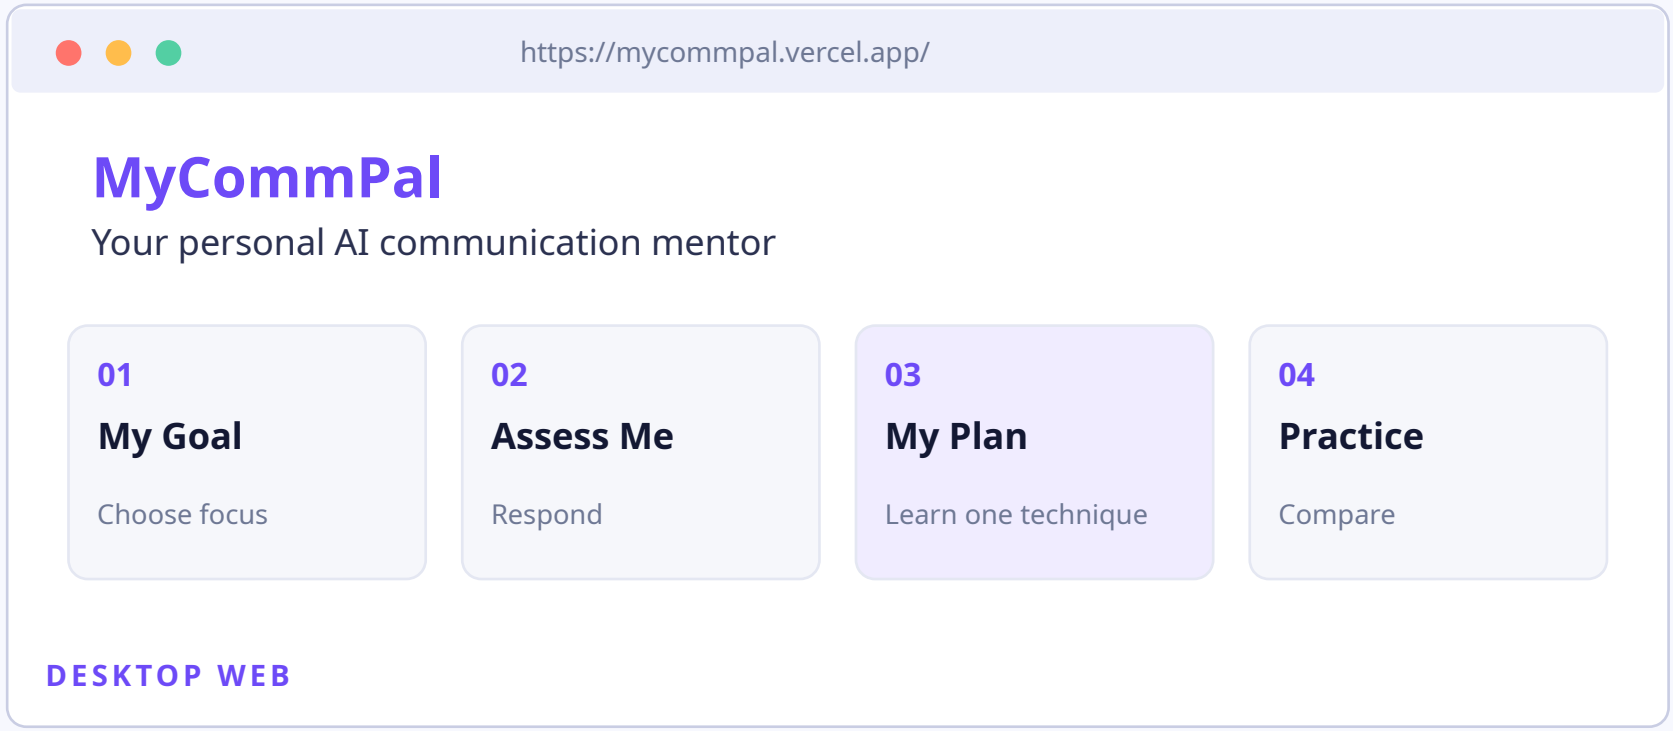

Problem statement
A working Product Manager struggles to explain product thinking clearly in high-pressure stakeholder conversations because they get too little realistic practice and too little specific feedback on what is not landing.

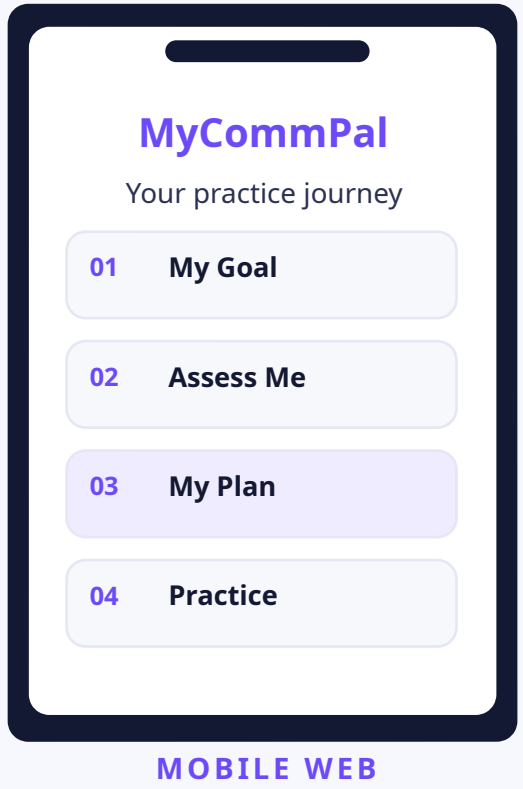

Hypothesis
If we give PMs a safe place to rehearse realistic scenarios, diagnose their biggest articulation gap, and coach one better retry, they will communicate more clearly and confidently.

This is why MyCommPal focuses on articulation—not broad public speaking.

One mentoring journey. Any screen.

MyCommPal runs in the browser on desktop and mobile — the same four-step experience adapts to the screen.

One experience • Responsive browser layout • No app installation

Illustrative responsive layout; live site is the source of truth.

Why MyCommPal is different

Generic LLMs

• Can roleplay if the user prompts well
• Often generate answers for you
• Feedback may be generic or inconsistent
• Strong substitute, but not a ready-made improvement loop

General speaking tools

• Good at pace, filler words, and confidence cues
• Useful for broad speaking practice
• Usually weak at judging product reasoning and trade-offs

MyCommPal

• PM-specific situations
• Evaluates clarity, structure, conciseness
• Adds product decision intelligence: decision, evidence, trade-off, impact
• Guides one focused retry instead of only rewriting the answer

MyCommPal's edge is not "AI feedback." It is the focused improvement loop for PM articulation.

MVP scope: one skill, one complete loop

IN SCOPE — THE CORE BET

- Select PM communication goal and scenario
- Capture baseline by text or speech
- Assess core articulation + relevant PM decision dimensions
- Learn one targeted technique
- Retry and compare attempts
- Collect real user feedback

OUT OF SCOPE — DELIBERATELY

- Video and body-language analysis
- Live, interruptible stakeholder voice simulation
- Full public-speaking courses and anxiety treatment
- Enterprise integrations and team dashboards
- Advanced long-term learning analytics and gamification

Trade-off: prove that one focused mentoring cycle creates value before broadening the platform.

Demo flow: show improvement in one conversation

DEMO SCENARIO

Executive review: propose prioritizing onboarding over reporting, explain why now, and state the decision needed from leadership.

Baseline attempt

“Onboarding feels important. Reporting can wait.”

Vira detects: weak rationale, weak trade-off, low executive clarity.

Practice 1

“I recommend onboarding first because new users struggle to activate, and that slows adoption.”

Vira improves clarity and decision statement.

Practice 2

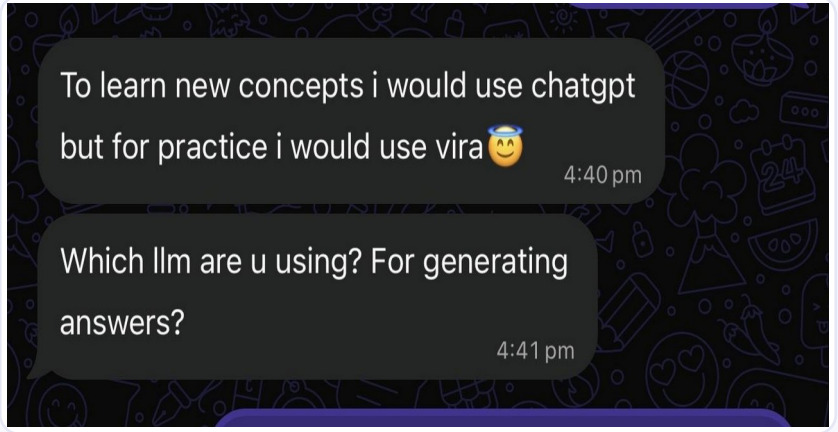

“We should prioritize onboarding now, defer non-critical reporting, and communicate the timeline. This improves activation sooner while containing reporting risk.”

Now the trade-off and impact land.

What the jury should see

Baseline → diagnosis → one focused technique → better retry. The innovation is the improvement loop, not just answer generation.

Real users: what resonated

What this tells us

• Users see a difference between learning concepts in ChatGPT and practising with Vira.
• The product already has a recognizable use case: rehearsal and feedback.

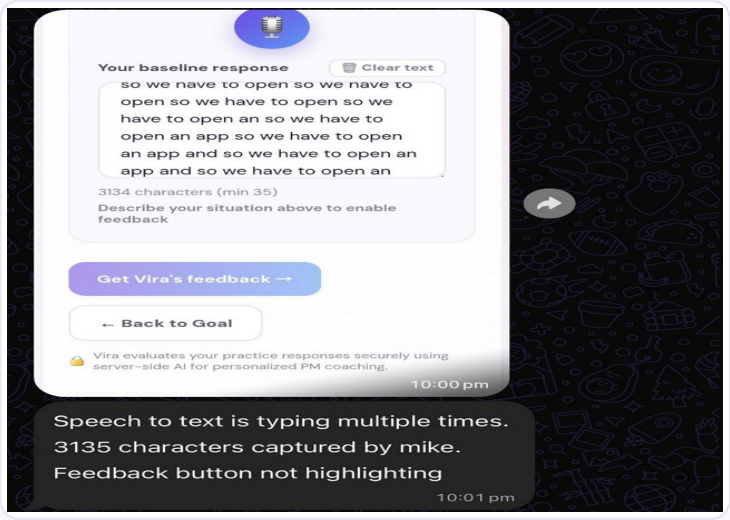

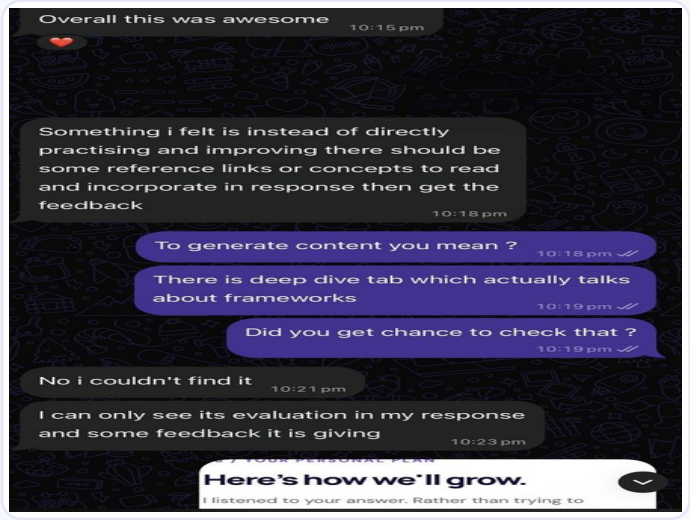

More positive signals

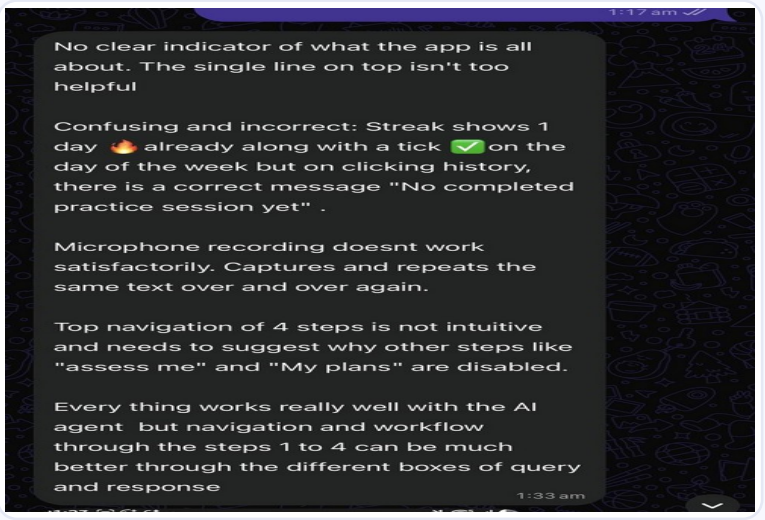

• Step-by-step flow felt easy to follow
• Guest mode reduced friction
• "One thing at a time" coaching made feedback easier to apply
• The "practise your real situation" option felt useful

These are early qualitative signals from real testers.

Real users: where they got stuck

Main friction themes

1. Voice input sometimes duplicated or stopped unexpectedly
2. Submission / comparison states were confusing in some flows
3. Framework content and deep-dive guidance were hard to discover
4. Landing page copy and step navigation needed to be clearer

Why this mattered

The tests helped us separate “good concept” from “good product.” Users liked the core value, but reliability and clarity shape trust.

Feedback changed the priorities—not the mission

What users valued

- Focused, step-by-step mentoring
- Real PM scenarios
- Guest access
- One improvement at a time

Changes reported in build

- Progressive disclosure of coaching
- Transcript deduplication logic
- Input and navigation handling
- Supabase session persistence

Still needs live retest

- Voice capture on real devices
- Practice comparison scores
- No previous-session carryover
- Accurate streaks and completion
- Discoverable technique examples

Reported fixes are based on implementation summary; production retest and 3–5 distinct tester records remain necessary.

GTM plan: earn the first 10 advocates

Start with working PMs who have real stakeholder conversations to prepare for.

01 Recruit

Initial 10 PM users identified:
5 colleagues · 4 HelloPM peers · 1 friend.
Invite each to practise one real stakeholder scenario.

02 Activate

Use guest access and one immediate personalized insight. Ask testers to complete the baseline → plan → retry journey.

03 Learn & iterate

Collect usefulness ratings and WhatsApp feedback; verify friction fixes, compare retries, and invite users back before real meetings.

Bhavana · Vivek · Srikanth · Naresh · Santosh | Charith · Manav · Nikhil · Chinmay | Ratan

Launch metrics to test — not achieved results

10 named first users • Track completed sessions • Feedback usefulness • 14-day return

AARRR — The Growth Plan

A — Acquisition

First 10 PMs

5 colleagues + 4 HelloPM peers + 1 friend

A — Activation

Aha in <2 min

One precise gap + actionable technique

R — Retention

Before real meetings

Return for roadmap / VP conversation prep

R — Referral

Share a useful result

Tell a PM colleague after a valuable retry

R — Revenue

Freemium hypothesis

Paid ongoing mentoring + deeper practice

North Star: completed mentoring cycles

Baseline assessment → targeted guidance → one or more retries. GTM targets are hypotheses, not achieved funnel metrics.
