MyCommPal | Real User Feedback Evidence

Buildathon supporting document • Early qualitative feedback from WhatsApp

Screenshots are drawn from the supplied Assignment 4 research document. Confirm that they represent at least 3 distinct testers before submission. Feedback is qualitative, reflects different application versions, and does not independently prove articulation improvement.

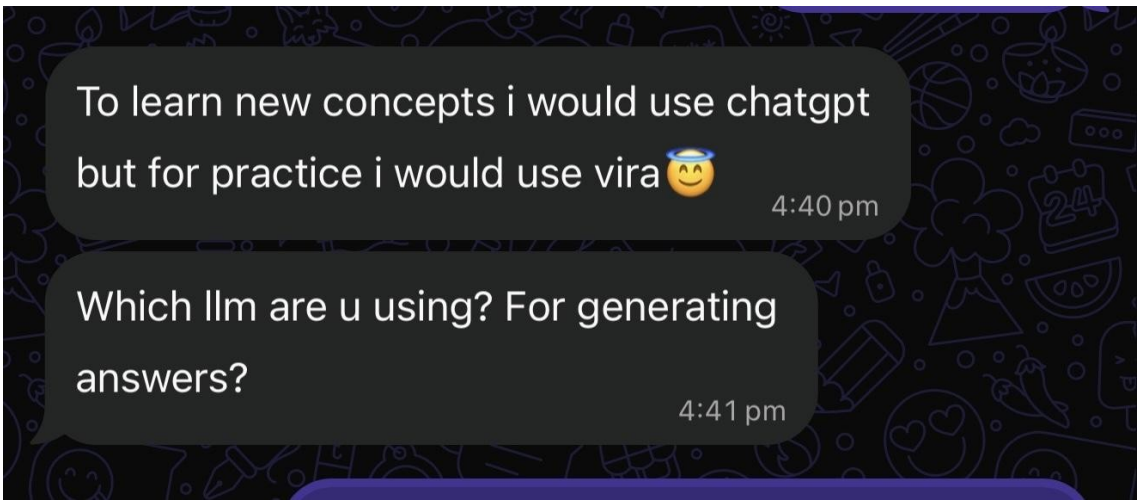

01 Users choose Vira for practice

“To learn new concepts i would use chatgpt but for practice i would use vira.”

What we learned: A tester recognizes the specialized practice journey as distinct from concept learning with a general AI assistant.

Product action / hypothesis: Retain focused, scenario-based diagnosis → guidance → practice → reflection.

Implementation status: To be confirmed against the current production build; no user retest evidence included in the research dump.

Source: WhatsApp screenshot supplied in Assignment 4; identifying details should be reviewed before sharing externally.

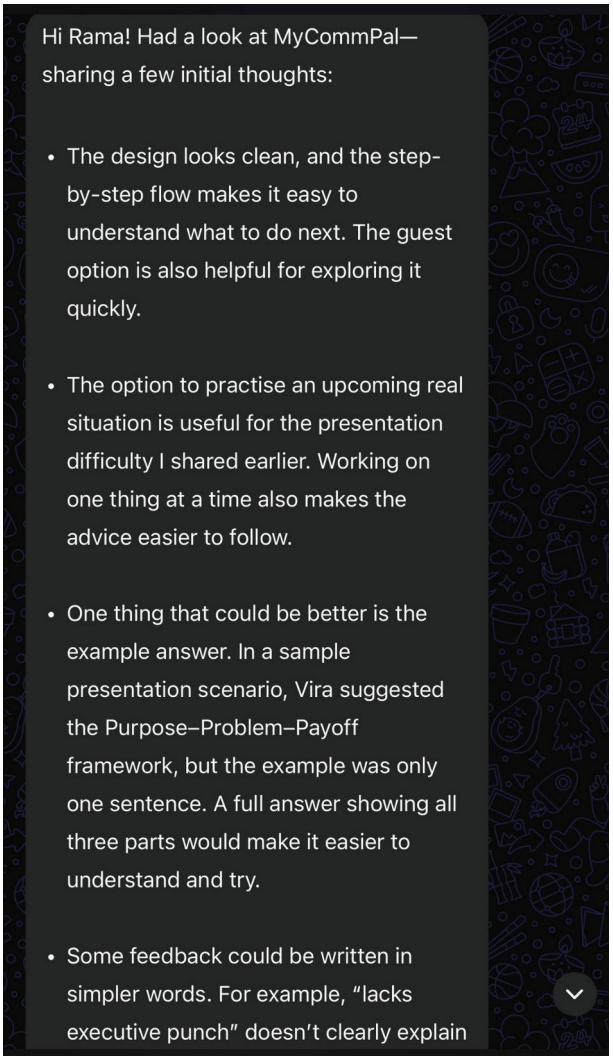

02 Guided mentoring is easy to follow

“Working on one thing at a time also makes the advice easier to follow.”

What we learned: The tester valued clean design, guest entry, realistic situations, and one focus at a time.

Product action / hypothesis: Preserve one recommended improvement upfront; make deeper guidance accessible.

Implementation status: To be confirmed against the current production build; no user retest evidence included in the research dump.

Source: WhatsApp screenshot supplied in Assignment 4; identifying details should be reviewed before sharing externally.

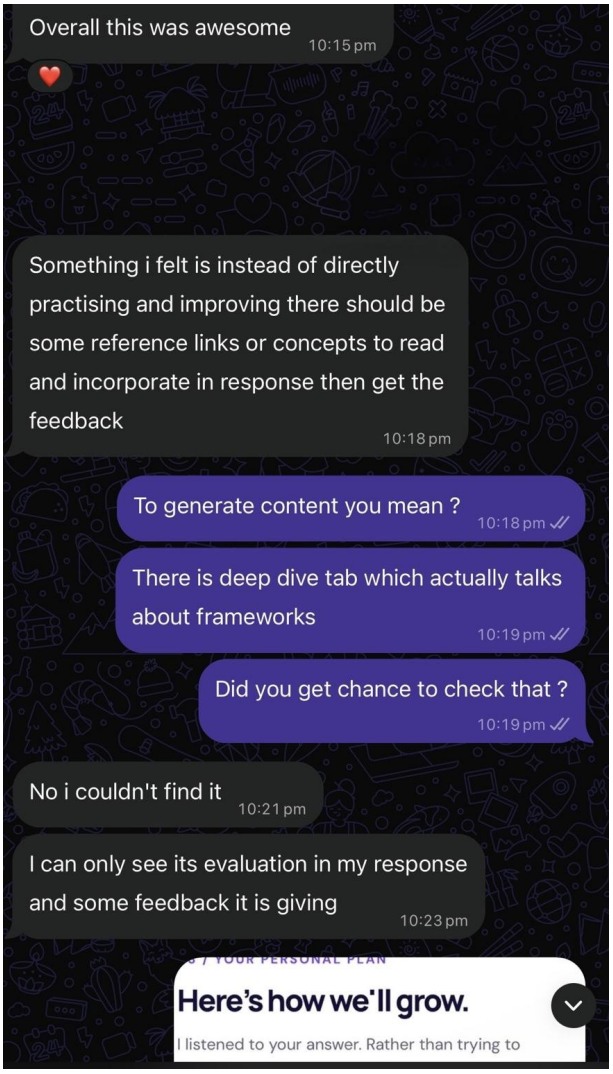

03 Learning guidance was hard to find

“No i couldn’t find it.”

What we learned: The tester wanted concepts before retrying but could not locate Deep Dive framework explanations.

Product action / hypothesis: Provide a visible “Learn this technique” path and test discoverability.

Implementation status: To be confirmed against the current production build; no user retest evidence included in the research dump.

Source: WhatsApp screenshot supplied in Assignment 4; identifying details should be reviewed before sharing externally.

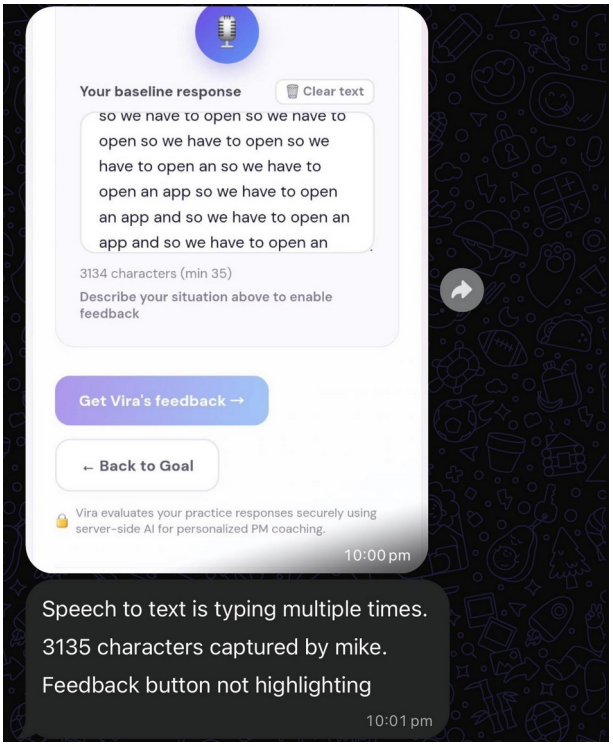

04 Voice transcription blocked progress

“Speech to text is typing multiple times.”

What we learned: The tester reported repeated transcription, >3,000 characters and an unavailable assessment action.

Product action / hypothesis: Retest deduplication, validation state, and microphone behavior on mobile.

Implementation status: To be confirmed against the current production build; no user retest evidence included in the research dump.

Source: WhatsApp screenshot supplied in Assignment 4; identifying details should be reviewed before sharing externally.

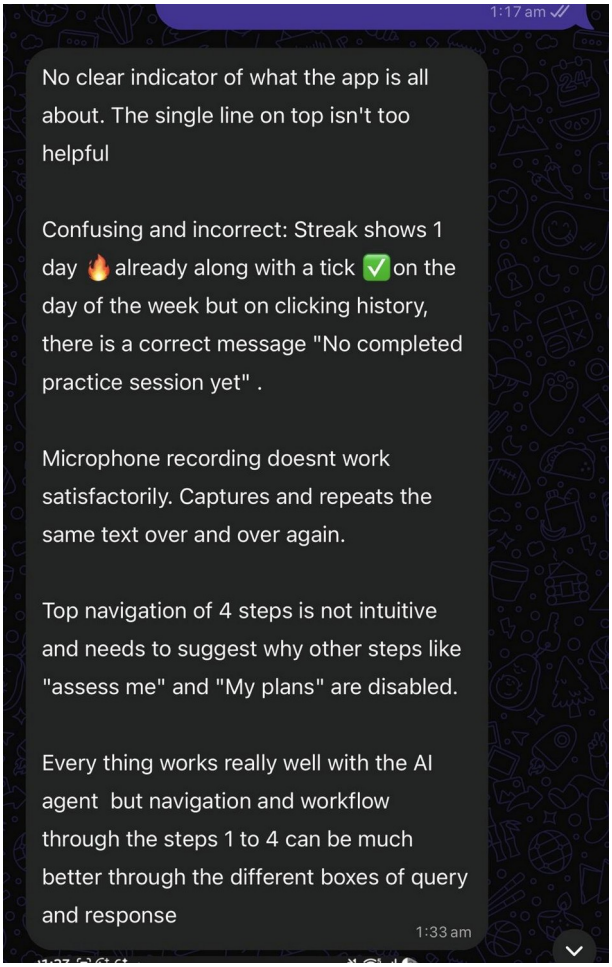

05 Progress and navigation were inconsistent

“Streak shows 1 day … [but] No completed practice session yet.”

What we learned: Streak/history disagreement and unexplained disabled steps can undermine user trust.

Product action / hypothesis: Align streaks with completed sessions and explain step prerequisites.

Implementation status: To be confirmed against the current production build; no user retest evidence included in the research dump.

Summary: Feedback → Product decisions

Finding	Priority	Validation required
Microphone duplication / cut-off	P0	Repeat voice tests on Android and iOS browsers
Missing practice comparison / session carryover	P0	Verify independent attempts, scores, and session reset
Framework discovery / plain-language advice	P1	Observe first-time users finding learning content
Streak/history disagreement / locked-step confusion	P0	Validate progress logic and explain unavailable steps
Practice-focused differentiation	Retain	Test actionability vs strong ChatGPT baseline

Evidence boundary: User testimonials support perceived value, not measured skill gains. Do not represent product decisions as completed engineering fixes without deployment/retest proof.
