MyCommPal | Buildathon Submission

Your Personal AI Communication Mentor

1 Working Product

Live application: https://mycommpal.vercel.app/

Source code: https://github.com/ramachinthapalli-ghub/mycommpal

How the jury can enter: Open the live app and choose “Continue as Guest” if presented. No demo email/password is claimed here. Verify guest access in a private browser window before submission.

Core journey: My Goal → Assess Me → My Personal Plan → Practice With Vira → Compare attempts.

Stack (documented): Next.js 14, Vercel, OpenAI API, Supabase, browser speech-to-text. Internal Antigravity report cites 12 decision-intelligence tests and 20 eval regressions passing; production behavior requires a live smoke test.

2 Real User Feedback

Evidence: Five WhatsApp screenshot excerpts (distinct tester count to confirm), with observed benefits, friction, and recommended product responses. See the accompanying User Feedback Evidence document.

Key signals: One user preferred Vira for practice over ChatGPT for concept learning; others valued focused mentoring, but reported transcription repetition, unclear framework discoverability, and navigation/progress issues.

Evidence discipline: Historical complaints are not labeled fixed without retest proof. Include a dated before/after result if you have one.

3 Short Jury Deck

Included: MyCommPal_Buildathon_Jury_Deck.pptx — user problem, research, differentiation, product journey, demo, user feedback, iteration priorities, and AARRR GTM.

Final Submission Checks

- Test guest entry on mobile and in incognito mode.
- Run a full live baseline → plan → Practice 1 → Practice 2 journey; inspect actual scores.
- Verify a feedback submission appears in Supabase; check permissions and error handling.
- Remove names, phone numbers, and identifiable details from any additional evidence.
- Recheck every slide against the deployed version; do not claim unverified bug fixes.
